

CALL CENTER OPERATIONS

Performance & Data Quality Review

Findings and Action Items — Two-Week Operational Window, May 2026

Christopher S. Girvin

Senior Analytics & BI Professional

What This Review Covers

- **Team Performance**

Are any of the four teams meaningfully behind the others
- **Agent Scorecard**

Which named agents are driving the result — up or down
- **Data Quality & Governance**

1,100 unmapped calls, traced to root cause
- **Recommendations**

The specific actions this review points to

Operations Overview

Two-week reporting window, May 4–15, 2026 — figures pulled directly from the call detail export

● TOTAL CALLS HANDLED

28,864

10 business days, May 2026

● AGENTS

103

across 4 teams

● RESOLUTION RATE SPREAD

65.4–100%

across 99 named agents

● UNMAPPED CALLS FLAGGED

1,100

3.8% of total volume

WHAT THE DATA ACTUALLY SHOWS

- Team-level performance is tight — all four teams land within 1.5 points of each other on resolution rate
- Agent-level performance is where the real spread lives: 65.4% to 100% resolution, 2.9-to-7.7-minute handle time
- Speed and resolution are essentially uncorrelated ($r \approx -0.06$) — being fast doesn't predict being thorough

REPORTING FOUNDATION

- 4 regional managers, 1 senior manager, 103 agents on the active roster
- Python standardizes 20+ messy legacy exports before anything reaches the reporting layer
- SQL Server window functions handle deduplication and ranking upstream
- This deck's charts are built directly from that governed export, not recreated by hand

Team Performance

Are any of the four teams meaningfully behind the others — short answer: no

RESOLUTION RATE BY TEAM (%)

AVERAGE HANDLE TIME BY TEAM (MIN)

WHY IT MATTERS

- All four teams sit within 1.5 points on resolution rate (92.0–93.5%) and 13 seconds on AHT (4.97–5.19 min) — no team is meaningfully behind
- That's a genuinely reassuring signal at the team level — the variance worth acting on isn't between managers, it's inside each of their rosters (next slide)

Agent Scorecard

Which named agents are driving the team result — up or down

RESOLUTION RATE — LOWEST & HIGHEST NAMED AGENTS (%)

NAMED FINDINGS

- Wei Adeyemi (T. Okafor's team): busiest agent on his roster (324 calls), yet lowest resolution (81.2%) and slowest AHT (6.42 min) of any team's top-volume agent — busiest ≠ best
- Sofia Mendoza (R. Castellano's team): single lowest performer company-wide at 65.4% resolution
- 3 of the 4 highest-resolution agents' company-wide sit under S. Lindqvist — worth documenting what that team does differently
- Speed and resolution barely correlate ($r \approx -0.06$) across all 99 agents — manage this agent-by-agent, not by AHT alone

Data Quality & Governance

The dashboard that makes the other two defensible

Recommendations

The specific actions this review points to

● Fix the source gap

Validate Agent Name at extraction — this gap held steady for all 10 business days, so it's a standing process fix, not a one-time cleanup

● Coach two named agents this cycle

Wei Adeyemi (busiest on his team, lowest resolution and slowest AHT among team leaders) and Sofia Mendoza (lowest resolution company-wide at 65.4%)

● Study S. Lindqvist's team

3 of the 4 highest-resolution agents' company-wide sit on this roster — worth documenting what's replicable before assuming it's just staffing luck

● Keep flagging, not dropping

The same discipline that caught this gap and these two agents should stay standard practice, every reporting cycle going forward

About This Deck

This deck is a portfolio sample demonstrating monthly operations reporting for a call center analytics program.

Every chart and number here was computed directly from `call_center_tableau_source.xlsx`, the same governed export that feeds the Tableau dashboards — Python standardizes the source exports, SQL Server window functions handle deduplication and ranking, and this analysis and Tableau both consume that same clean output.

All figures are synthetic and representative. No actual employer, client, or proprietary data is used.
